

CASH VALVES TYPE G-4 PRESSURE REGULATORS

A self-actuating pilot operated pressure reducing valve handling air, gas and steam and accurate to within 1/2% up to 3" and 1% for sizes to 6"

FEATURES

- Extremely compact design enables use of a smaller regulator.
- Constant outlet pressure up to the valve's maximum rated capacity regardless of changes in flow rate or inlet pressure.
- Very high flow rates due to the main valve assembly's full lift capability valve body design.
- Positive shut-off ensured by accurate guiding of the pilot and main valve assemblies. Non-metallic trims available for dead tight shut-off on air and gas applications.
- Pilot valve component parts interchangeability simplifies maintenance and allows greater spare parts flexibility.
- Available in bronze, cast iron and steel construction to allow for pressures up to 600 psi and temperatures up to 800°F.
- Specially prepared parts kits enable simple routine servicing or complete overhauls.

GENERAL APPLICATION

Suitable for use on steam heating lines, dryers, ovens, oil heaters, molding machines, steam jacketed equipment, sterilizers, large capacity kilns, retorts, heat exchangers, paper and board machines, cookers and any other steam, air and gaseous application.

TECHNICAL DATA

Materials: Iron, bronze, cast and stainless steels
Sizes: 1/2" to 2" threaded
1/2" to 6" flanged
Maximum inlet pressure:
600 psig (41.3 barg)
Reduced pressure range:
1 to 300 psig (.07 to 20.7 barg)
Max. temperature:
800°F (427°C)

MINIMUM PRESSURE DIFFERENTIAL

The pressure differential is the difference between the inlet pressure and outlet (reduced) pressure. The minimum allowable pressure differential varies depending upon both the inlet pressure and the size of the valves.

Valve size	Inlet press. range (psig)	Minimum press. differential (psig)
1/2"-2"	10-50	5

CASH VALVES TYPE G-4 PRESSURE REGULATORS

Typical installation

OPERATION

The G-4 regulator is primarily designed for use on steam although it works equally well with air and gases. It will maintain a constant pressure irrespective of variations in inlet pressure or steam demand from the system.

Steam at inlet pressure passes through the inlet relay port (G) to the pilot valve (D). Both pilot and main valves (H) initially are closed by the action of the pilot and main valve springs (E and I).

The pilot valve is opened by clockwise rotation of the adjusting screw (A) which compresses the adjusting spring (B) and applies load to the topside of the diaphragm (C), pushing open the pilot valve. Steam at inlet pressure now passes through the pilot valve and a relay port (K) to the piston (F), which pushes open the main valve.

The inlet steam pressure is reduced as it passes through the open main valve and seat to the valve outlet. At the same time steam at outlet pressure passes up the relay port (L) to the underside of the diaphragm.

The opening of the main valve determines the outlet pressure and this, in turn, is controlled by the pilot valve. The outlet pressure is a result of balancing the action of the adjusting spring on the top of the diaphragm against the reduced pressure acting on the underside, thus controlling the opening of the pilot valve.

The sensitivity of the diaphragm and adjusting spring ensure that any variation in reduced pressure will cause the pilot valve to open or close sufficiently to move the piston and main valve between the fully open and closed positions. In this way, the outlet pressure is maintained accurately under all operating conditions. Outlet pressure is increased by clockwise rotation of the adjusting screw or decreased by counter-clockwise rotation.

STANDARD ASSEMBLY

LOW PRESSURE TOP ASSEMBLY

REMOTE CONTROL

*NOTE

We recommend a remote sensing connection be fitted whenever:

1. The outlet pressure is below 55% of the inlet pressure.
 2. A low pressure top assembly is fitted.
 3. Difficult outlet pipework conditions occur.
- Please refer to factory for more details.

A special low pressure top assembly should be fitted for outlet pressures from 1 up to 5 psig (0.07 to 0.3 barg). Low pressure tops are available for valves up to 4" (100 mm) size. Larger valves are not suitable for outlet pressures of less than 5 psig (0.3 barg).

The low pressure top is supplied as a complete conversion unit for fitting to the existing pilot valve assembly. It incorporates a large diaphragm, providing a greater effective area and improved sensitivity to very low outlet pressure conditions.

CASH VALVES TYPE G-4 PRESSURE REGULATORS

Specifications

SPRINGS

VALVE SIZE

1/2" - 4"		5" and 6"*
1 - 5		5 - 20
5 - 50	(Yellow)	10 - 50
10 - 100	(Black)	40 - 100
40 - 150	(White)	50 - 175
50 - 200	(Green)	
100 - 300	(Red)	

NOTE

It is advisable to select a spring which will ensure that there is at least 10% extra adjustment available above the required reduced set pressure. The spring with the lowest pressure range should be used whenever possible.

*Not color coded

MATERIALS OF CONSTRUCTION

These capacities are based on a 3% variance from the regulator's set point.

Gas	Oxygen	Nitrogen	Hydrogen	Helium	CO ₂	Argon	Methane
Factor	1.05	0.98	0.26	0.37	1.24	1.18	0.74

To find valve capacities for gases at ambient temperatures multiply required flow rate by Approximate factor. Use chart above for valve capacity.

CASH VALVES TYPE G-4 PRESSURE REGULATORS

HOW TO ORDER

Specify Cash Valve type G-4 and state:

1. Pipe size
2. End connections
3. Inlet pressure
4. Outlet pressure range and setting
5. Maximum flow rate desired
6. Service
7. Trim
8. Body material
9. Operating temperature
10. For remote sensing: order remote control adapter

NOTE

NPTF, also referred to as 'Dryseal' thread, is designed to provide a more leak-free seal without the use of PTFE tape or other sealant compound. NPTF threads are interchangeable with NPT threads and are standard on all Cash Valve products.
